1 Introduction

1.1 Goal

Silva and Tenreyro¹ wasn't just an influential article, it defined my interest in gravity models to the point I wrote a master's thesis on it for UN ESCAP. Here I replicate the main results from the original article in R. The original results were obtained in Stata back in 2006.

The idea here is to be explicit regarding the conceptual approach to regression in R. For most of the replication I used base R² without external libraries (i.e packages) except when it was absolutely necessary.

Much of the methods exposed here lead to the exact same results as using the gravity package³ which provides convenient wrappers for gravity estimation.

All questions are welcome to the address mv.sepulveda@mail.utoronto.ca.

1.2 Usual disclaimer

The views and opinions expressed in this course are solely those of the author and do not necessarily reflect the official position of any unit of the United Nations, the University of Toronto or the Pontifical Catholic University of Chile.

2 Obtaining the original codes and data

I shall organize the original codes and data from the authors' site to put these on GitHub and therefore ease reproducibility in case of broken links or anything that makes it difficult to obtain the original zip file with the data and codes.

```
url <- "https://personal.lse.ac.uk/tenreyro/regressors.zip"
zip <- gsub(".*/", "", url)
if (!file.exists(zip)) try(download.file(url, zip))</pre>
```

¹"The Log of Gravity."

 $^{{}^{2}}$ R Core Team, R.

³Woelwer et al., Gravity.

```
dout <- "regressors"
if (!dir.exists(dout)) unzip(zip, exdir = dout)</pre>
```

3 Loading the original data

Thanks to the haven package⁴ we can read Stata datasets directly in R without loss of information about column types and other common problems when reading proprietary formats.

```
log_of_gravity <- haven::read_dta(paste0(dout, "/Log of Gravity.dta"))</pre>
```

4 Replication attempt

4.1 Poisson Pseudo Maximum Likelihood

Table 3 in Silva and Tenreyro⁵ summarises a large portion of the article and it can be partially replicated with the following Stata code for the Poisson Pseudo Maximum Likelihood.

```
ppml trade lypex lypim lyex lyim ldist border comlang colony landl_ex
landl_im lremot_ex lremot_im comfrt_wto open_wto
```

In R we would replicate it by fitting two Generalized Linear Models since the article introduces estimates with and without removing zero flows.

```
ppml_formula <- trade ~ lypex + lypim + lyex + lyim + ldist + border +
  comlang + colony + landl_ex + landl_im + lremot_ex + lremot_im +
  comfrt_wto + open_wto</pre>
```

⁴Wickham and Miller, haven: Import and Export SPSS, Stata and SAS Files.

⁵"The Log of Gravity."

```
fit.ppml_1 <- glm(
    ppml_formula,
    data = log_of_gravity,
    subset = trade > 0,
    family = quasipoisson()
)

fit_ppml_2 <- glm(
    ppml_formula,
    data = log_of_gravity,
    family = quasipoisson()
)</pre>
kable(broom::tidy(fit_ppml_1))
```

open_wto	-0.1068187	0.0287357	-3.717287	0.0002020

The replication effort here is null, it just sufficed to look at the summary table in the article and subset the data to drop zero flows. Therefore, it makes sense to proceed with the other models.

4.2 Ordinary Least Squares

The only consideration here is to drop zero flows for some of the models with log in the dependent variable even when Table 3 is not explicit about this, otherwise we break the fitting algorithm.

For example, for estimations of the type $\log(\text{trade}) = \beta_0 + \beta_1 \text{lypex} + \cdots + \varepsilon$, we need to drop zero flows to replicate the result. On the other hand, for estimations of the type $\log(1 + \text{trade}) = \beta_0 + \beta_1 \text{lypex} + \cdots + \varepsilon$, we don't need to drop zero flows.

```
fit_ols_1 <- lm(
    update.formula(ppml_formula, log(.) ~ .),
    data = log_of_gravity,
    subset = trade > 0
)

fit_ols_2 <- lm(
    update.formula(ppml_formula, log(1 + .) ~ .),
    data = log_of_gravity
)</pre>
```

4.3 Tobit

The Tobit estimation is similar but requires the use of the censReg package.⁶ The complicated part of the estimation here is to extract the right hand side of the model formula to define a vector of zeroes of the length of this right hand side plus two as starting point for the Maximum Likelihood estimation (i.e including the depending variable and intercept besides the estimating slopes).

In order to obtain the a value that matches the results in the article I proceeded with an iteration loop until achieving convergence with respect to one of the estimated slopes. The initial value of a = 200 was arbitrary and set after trying reasonable guesses that converge to

⁶Henningsen, censReg: Censored Regression (Tobit) Models.

the slopes in the original article after 9 iterations for a final value of a = 159.

```
a < -200
lypex_ref <- 1.058
tol <- 0.001
lypex_estimate <- 2 * lypex_ref</pre>
iter <- 0
while (abs(lypex_estimate - lypex_ref) > tol) {
  log_of_gravity$log_trade_cens <- log(a + log_of_gravity$trade)</pre>
  log_trade_cens_min <- min(log_of_gravity$log_trade_cens, na.rm = TRUE)</pre>
  fit_tobit <- censReg::censReg(</pre>
    formula = update.formula(ppml_formula, log_trade_cens ~ .),
    left = log_trade_cens_min,
   right = Inf,
    data = log_of_gravity,
    start = rep(0, 2 + length(attr(terms(ppml_formula), "term.labels"))),
    method = "BHHH"
  )
  lypex_estimate <- coef(fit_tobit)[2]</pre>
  if (abs(lypex_estimate - lypex_ref) > 2 * tol) {
    a < -a - 5
  } else {
    a < -a - 1
  }
  iter <- iter + 1
```

4.4 Non-Linear Least Squares

For this type of estimation the starting values are retrieved from the results of the PPML model with zero flows and then we pass these values to a Generalized Linear Model using the Gaussian distribution and a log-link.

```
fit_ppml_eta <- fit_ppml_2$fitted.values
fit_ppml_start <- fit_ppml_2$coefficients

fit_nls <- glm(
    ppml_formula,
    data = log_of_gravity,
    family = gaussian(link = "log"),
    etastart = fit_ppml_eta,
    mustart = fit_ppml_mu,
    start = fit_ppml_start,
    control = list(maxit = 200, trace = FALSE)
)</pre>
```

5 Replication results

There wasn't much effort involved in the replication, which is something desirable. I didn't even have to email the authors with questions whereas the data was filtered or transformed in ways not mentioned in the article, which is something that we often see. Unlike many articles, this is one of the very few articles that I've found which passes the reproducibility review and is very close to full replication according to the criteria from Peng⁷.

⁷"Reproducible Research in Computational Science."
